What it does and why it matters

RyFine is most useful when you need better prompts without switching into a longer prompt-engineering workflow. This guide shows the shortest path from first load to first useful result.

Leave with one refined prompt, one working provider setup, and a clear mental model of how the product fits into your daily flow.

Step-by-step workflow

STEP 1

Pick a provider that matches your privacy and speed needs

Open Settings and choose Browser AI or Ollama for local runs, or a hosted provider if you want a stronger remote model. Add the key once if the provider requires it.

ANNOTATION

Keys stay in this browser only. Nothing is proxied through RyFine servers.

STEP 2

Paste the raw prompt exactly as it exists in your head

Use the left pane for messy input. Do not over-edit. RyFine works best when it can clean up the ambiguity, missing constraints, and incomplete framing for you.

ANNOTATION

Short, vague, or overloaded prompts are fine. That is the point of the refinement pass.

Now you can select the left pane and paste your prompt. It will look like this.

STEP 3

Run RyFine and inspect the output before copying it onward

Click RyFine or use the keyboard shortcut. Watch the result stream in on the right. If you want to verify the logic behind the rewrite, review the trace and assembled prompt details before copying.

ANNOTATION

The goal is a better prompt, not an answer to the task itself.

SUMMARY

Quick brief

The fastest path to value for new users: choose a provider, run your first refinement, and copy the result into the tool you already use.

USE CASES

Where this guide helps most

- Turn a fuzzy coding request into a scoped implementation brief.
- Rewrite a content draft into a production-ready AI writing prompt.
- Tighten a research question before sending it to a higher-cost model.

BEST PRACTICES

Keep the workflow tight

- Keep the initial prompt honest instead of pre-polished.
- Use one provider and one model for your first few runs to build intuition.
- Copy the refined prompt into the destination tool right away so the workflow feels natural.
